In Milestone for Women’s HIV Prevention, European Medicines Agency Adopts Positive Opinion on Monthly Vaginal Ring to Reduce HIV Risk

IPM’s Dapivirine Ring Could Give Women in Sub-Saharan Africa First Long-Acting HIV Prevention Option; Opinion Paves Way for WHO and National Regulatory Reviews

SILVER SPRING, Md. (July 24, 2020)—The International Partnership for Microbicides (IPM) today welcomed a positive opinion from the European Medicines Agency (EMA) on the dapivirine vaginal ring for use by cisgender women ages 18 and older in developing countries to reduce their risk of HIV-1 infection. The monthly ring is the first long-acting HIV prevention product and is designed to help address women’s unmet need for new methods given the persistently high rates of HIV they face, especially in sub-Saharan Africa. Today’s news opens the door to next steps needed to seek approvals for the ring in countries where the need is most urgent.

“The EMA’s opinion is a significant step forward for women, who urgently need and deserve new, discreet options to manage their HIV risk on their own terms,” said Dr. Zeda F. Rosenberg, founding chief executive officer of IPM, the nonprofit that developed the dapivirine ring and is the product’s regulatory sponsor. “As we celebrate today’s news with the many partners around the world involved in the ring’s development, we also look ahead to the collective effort still needed to obtain country approvals to make the ring available to women in sub-Saharan Africa.”

The EMA’s Committee for Medicinal Products for Human Use reviewed the ring under the Article 58 procedure, which it conducts in cooperation with the World Health Organization (WHO) to facilitate access to essential medicines in low- and middle-income countries using the same rigorous standards as for products intended for use in the European Union. IPM submitted its Article 58 application in June 2017.

Global partnerships with researchers, trial communities in Africa, Europe and the United States, civil society, governments, industry and donors spanning 16 years of research and development led to today’s positive opinion.

“This achievement is a testament to what partnerships can accomplish,” continued Dr. Rosenberg. “We applaud the researchers in Africa, Europe and the US who expertly conducted studies that brought the ring to this exciting point—and especially thank the pioneering women who participated in the studies for their commitment to finding new woman-centered options that can fill a critical gap in the HIV prevention portfolio.”

Efficacy data, including additional data provided during the EMA’s review, showed that IPM’s dapivirine ring reduced women’s HIV risk by 35% with no safety concerns with long-term use. More recent data from open-label extension (OLE) studies of the product suggested greater HIV risk reduction, although those findings are based on statistical modeling and are therefore limited. The ring was also found to have a favorable safety profile in all clinical trials to date.

IPM submitted to the EMA for its assessment data from a package of studies, including two Phase III studies—The Ring Study led by IPM, and ASPIRE, conducted by IPM’s clinical trial partner the National Institutes of Health-funded Microbicide Trials Network (MTN)—two subsequent OLE studies, and a number of smaller safety studies.

In addition to working closely with the WHO during its review, the EMA’s evaluation also included the testimony of two women living in countries in Africa where there is a high burden of HIV.

As the EMA requested, IPM will also conduct additional research among cisgender women ages 18-25 to better understand the ring’s efficacy and to collect additional data on safety and potential ARV resistance. Results from the study could also inform strategies to support young women to use the ring consistently.

A potential new option to meet women’s needs

As the EMA indicated, the monthly ring could be an important option for women who choose not to or are unable to use the daily oral antiretroviral (ARV) pill known as PrEP (or pre-exposure prophylaxis), now becoming more widely available in Africa. Oral PrEP is highly effective, but not all women are able to use it. In addition, although condoms will be indicated for use with the ring, they are not practical for women who are unable to negotiate their use with male partners or who are at risk of sexual or intimate partner violence.

“Women in Africa have been left behind by progress against HIV for far too long, and today’s announcement is a landmark for women’s HIV prevention,” said Dr. Linda-Gail Bekker, professor of medicine and deputy director of the Desmond Tutu Health Foundation, immediate past president of the International AIDS Society and national principal investigator for South Africa on The Ring Study. “Offering women multiple methods like the monthly ring and daily oral PrEP is vital to controlling the epidemic and to ensuring their sexual and reproductive health and rights.”

The ring is designed to help reduce women’s HIV risk during vaginal sex. Women insert the product themselves and replace it every month. Made of flexible silicone, the ring slowly releases the ARV dapivirine locally to the site of potential infection, with minimal absorption elsewhere in the body.

“Today’s announcement brings us closer to a future where every woman has the opportunity to protect herself against HIV,” said Paul Stoffels, MD, vice chairman of the executive committee and chief scientific officer at Johnson & Johnson, which granted IPM the rights to dapivirine and is partnering closely with the nonprofit to plan for the ring’s potential rollout. “If we continue investing in the development of innovations like the dapivirine ring—and ensuring that they are accessible to those who need them most—I have no doubt we will see a day when HIV is a disease of the past.”

Although new HIV infections are declining overall, biology and gender inequities make women more susceptible to infection than men. Every day, nearly 1,400 women in sub-Saharan Africa acquire HIV.

“Even as HIV/AIDS has increasingly become an epidemic borne by women and girls, the response to it has not kept pace,” said Dr. Peter Piot, director of the London School of Hygiene & Tropical Medicine and the founding executive director of UNAIDS. “As the first long-acting tool for HIV prevention, the dapivirine ring could help change the course of the epidemic for women.”

Next steps for potential country approvals and introduction

Given the urgency for women, IPM has been working with partners to shorten the time to potential introduction as much as possible, but rolling out the ring will require a collective effort by a range of global stakeholders, particularly as responding to COVID-19 alongside other priorities continues to challenge health systems. With strong political will and funding, it may be possible to begin making the dapivirine ring available sometime in 2021 in some communities in Africa where the need is urgent, pending several next steps, including:

- **WHO guidelines and prequalification:** WHO will review evidence on the ring as part of its guideline process and consider using an abbreviated review of the product for prequalification, a quality assurance designation for medicines that facilitates access to medicines that meet global standards for quality, safety and efficacy.
- **Regulatory reviews in Africa:** In parallel, the ring will be reviewed by regulators in each country where it would be used and, if approved, adopted into national HIV prevention policies. Because the EMA's Article 58 opinion is recognized by many countries in Africa and IPM is submitting to those countries through a process coordinated by the WHO, it may help accelerate national reviews. IPM plans to submit the first applications this year to countries in eastern and southern Africa where the need remains high, studies of the ring took place and where IPM can build on oral PrEP implementation (Kenya, Malawi, Rwanda, South Africa, Tanzania, Uganda and Zimbabwe).
- **US regulatory review:** IPM will also submit to the US Food and Drug Administration in 2020.
- **Continued market and implementation research:** Market and implementation research has been underway with partners for several years to inform demand creation strategies; develop information, education and communications (IEC) materials for women and healthcare providers; create product delivery models; and to map the supply chain networks needed for rollout.
- **Ring rollout:** IPM will also continue working with governments, funders and other partners to discuss and plan for ring introduction.

“Women across Africa have been asking and waiting for new tools that put women in charge of their own health, so we welcome today’s announcement,” said Yvette Raphael, who leads the Advocates for the Prevention of HIV in Africa. “We now look to governments and funders, always in consultation with communities, to make sure the dapivirine ring reaches the women who need it.”

IPM is collaborating with MTN to study the monthly ring among adolescent girls, pregnant women and breastfeeding women, who are also at elevated HIV risk. Results from these studies could inform next steps on potentially expanding the indication for the ring to these groups in the future.

Given today’s news, IPM will accelerate development of follow-on rings that could help meet women’s HIV prevention needs at different times in their lives, including a longer-acting three-month dapivirine ring and a multipurpose prevention ring designed to offer both HIV prevention and contraception. Both products recently completed Phase I safety clinical trials.

IPM is grateful for the generous support of our current donors whose investment in our work has brought us to today's positive opinion: the Danish Ministry of Foreign Affairs, the German Federal Ministry of Education and Research (BMBF) through the KfW Development Bank, Irish Aid, the Ministry of Foreign Affairs of the Netherlands, UKaid from the Department for International Development, the American people through the United States Agency for International Development (USAID) in partnership with the US President's Emergency Plan for AIDS Relief (PEPFAR), and the Bill & Melinda Gates Foundation.

In addition, IPM also extends its thanks to donors whose previous support contributed to the ring's development, including: Belgian Development Cooperation; Canadian International Development Agency (CIDA); European Commission (EuropeanAID Cooperation Office/AIDCO); Federal Ministry for Economic Cooperation and Development, Germany (BMZ); M.A.C. AIDS Fund; The Government of Flanders; Ministry of Foreign Affairs, France; Ministry of Foreign Affairs and Cooperation, Spain (AECID); Ministry for Foreign Affairs, Sweden; Norwegian Agency for Development Cooperation (Norad); OPEC Fund for International Development (OFID); Rockefeller Foundation; Swedish International Development Cooperation Agency (SAREC); The World Bank; and United Nations Population Fund (UNFPA).

###

About dapivirine: Dapivirine is a non-nucleoside reverse transcriptase inhibitor that blocks HIV's ability to replicate itself inside a healthy cell. IPM holds an exclusive worldwide license for dapivirine from Janssen Sciences Ireland UC, one of the Janssen Pharmaceutical Companies of Johnson & Johnson. The license is designed to ensure that women in low-resource settings have affordable access to any dapivirine-based vaginal HIV prevention method.

About IPM: IPM is a nonprofit organization dedicated to developing new HIV prevention tools like the dapivirine ring and other sexual and reproductive health technologies for women, and making them available in developing countries. IPM has offices in the United States, South Africa and Belgium. Please visit www.IPMglobal.org.
