

The REACH Study (MTN-034)

Filling the Gaps for HIV Prevention in
Adolescent Girls and Young Women in Africa

Lulu Nair/ Kenneth Ngure

MTN-034 Protocol Chair/Co-Chair

Desmond Tutu HIV Centre, University of Cape Town

Jomo Kenyatta University of Agriculture and Technology

Young Women Need Prevention

- Adolescent girls and young women (AGYW) are especially at high risk of HIV and need methods for protection
- Young women 15-24 years account for 30% of new adult infections in SSA
- Twice as likely to acquire HIV infection as young men
- 25% of maternal mortality related to HIV/AIDS
- Women who experience IPV and sexual assault 1.5 times more at risk for HIV infection

Prevention Options For Women

- Negotiate male condom use- can incite violence
- Female condoms: unpopular, indiscreet and difficult to access
- TasP: Rely on partner to test, disclose status, seek treatment and adhere to treatment
- Oral PrEP

Current HIV Prevention Landscape

“Available” Now

Oral PrEP

Available 2020?

Vaginal ring

**Results 2023?
(Approval 2026?)**

Injectable

**Results 2021-22?
(Approvals 2024?)**

Vaccine

- Current strategies have not significantly impacted the vulnerability of adolescent girls and young women to HIV
- Adherence remains a challenge: No product can protect against HIV if it is not used
- Women need prevention modalities that meet their individual needs and fit their lifestyle
- Choice is important for effective use: uptake, persistence and adherence

What we know about the ring and PrEP

- Monthly dapivirine ring
 - Developed by the International Partnership for Microbicides, which is seeking its regulatory approval – for women ages 18 and older
- Regulatory approvals are based mainly on results of Phase III placebo-controlled trials (in 18+)
- Both PrEP and ring are user-controlled, discreet methods and only effective if used as indicated
- PrEP and ring trials had similar results
 - Both approaches were safe and effective with consistent use
 - Not effective in younger women – ages 18-25 – due to poor adherence

What we know about PrEP and ring adherence

- Both topical and oral PrEP effectiveness increase with higher adherence
- In phase III trials, product adherence among AGYW has been sub-optimal and is related to the following:
 - Healthy participants may not perceive themselves to be at risk
 - Motivation to participate in order to access high quality, confidential services from non judgmental and supportive staff
 - Unknown safety and efficacy profile of product
 - Possible randomization to placebo

What do we know about the ring in *adolescent girls*?

- In MTN-023/IPM 030, 96 girls in the U.S. ages 15-17 were randomized to use a placebo ring or the dapivirine ring monthly for 6 months
 - The dapivirine ring was safe and acceptable; adherence was very high
 - **What about girls in Africa?**

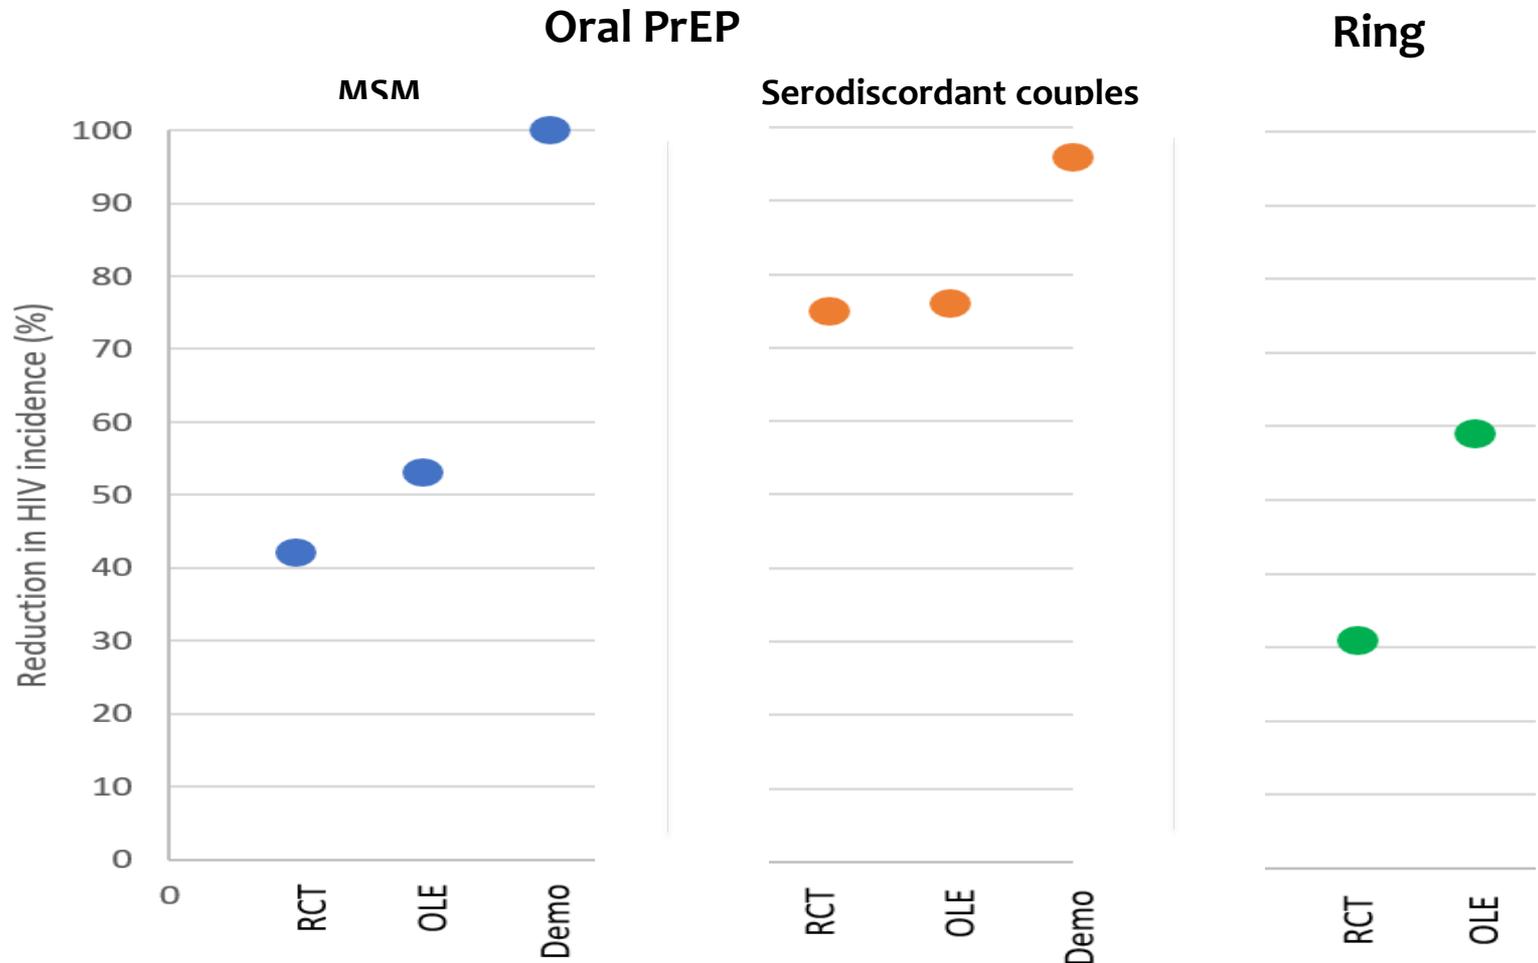

What do we know about PrEP in *adolescent girls*?

- POWER study: Study of PrEP delivery among women ages 16-24 in South Africa and Kenya
 - About half do not return at 1 month; 20% restart within 3 months
 - Discontinuations due to AEs (13%) and challenges with adhering to a daily pill regimen (13%) were common during first month of use
- PlusPills: Open-label study with 150 adolescents ages 15-19 from South Africa:
 - Adherence did not differ between sexes
 - Adherence decreased as visit frequency decreased from monthly to quarterly

Increased Effectiveness

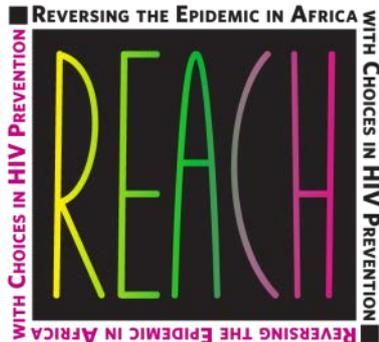

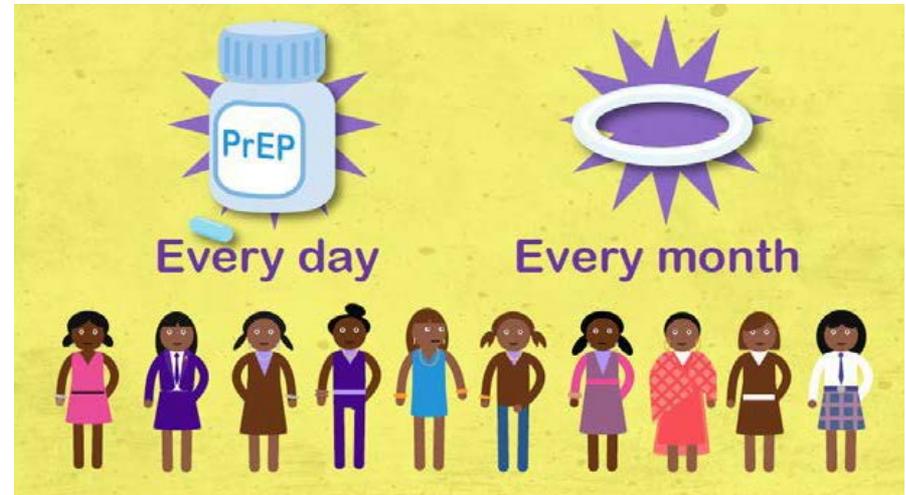

RCTs → Open label extensions → Demo projects

Why REACH?

We need to see that PrEP and the ring can work for and be made available to adolescent girls and young women ... How?

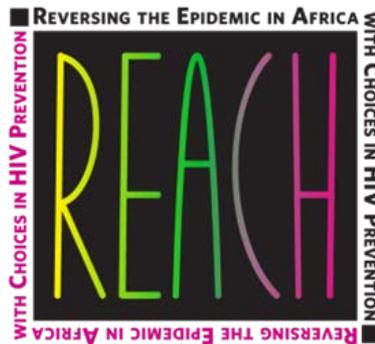

REACH aims to:

- Learn how to help young women use these methods better so they have the benefit of protection
- Collect more information about the safety of PrEP and the ring – including in girls under age 18 – so drug regulatory authorities can consider expanding approval

REACH (MTN-034) at a Glance

Reversing the Epidemic in Africa with Choices in HIV Prevention

- Randomized, open-label safety and adherence study of the dapivirine vaginal ring and oral PrEP
- Will enroll 300 girls and young women at 5 trial sites in Kenya, Uganda, South Africa and Zimbabwe
 - 100 girls ages 16-17
 - 200 young women ages 18-21
- Crossover design -- All participants will use PrEP and the ring – each for 6 months – and choose which to use for another 6 months

The REACH Study: Try each, then choose

6 months
once a month

6 months
once a day

6 months

or

6 months

once a day
6 months

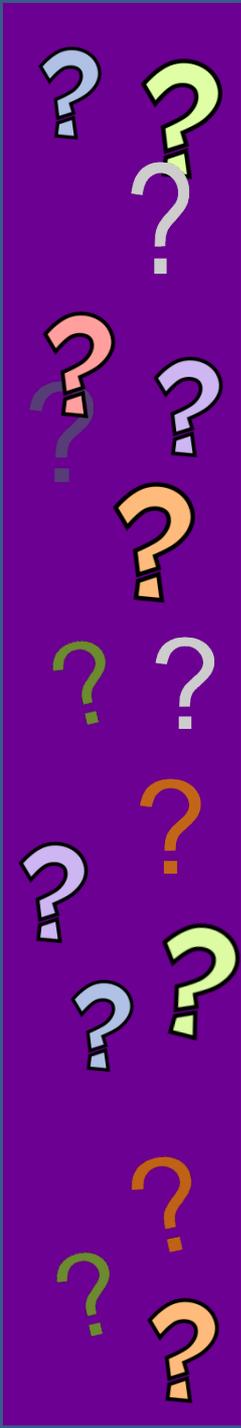

once a month
6 months

Questions being asked in REACH

- Will young women be more inclined to use these products...
 - In a study with no placebo?
 - Knowing that previous studies found them safe?
 - Knowing they can only work with consistent use?
- Is one easier to use than the other?
- Do they like one more than the other?
Or do they not like either?
- How might life circumstances influence choice?
- What can we do to help them to use these products?
- What about 16-17 year old girls? They are at risk for HIV & need access to effective products

Questions being asked about REACH

- Is it ethical to study dapivirine ring in AGYW, given no efficacy in ASPIRE and RING study in 18-21 year olds, and given that oral PrEP has known efficacy?
 - *Reminiscent of critiques of oral PrEP in AGYW*
 - *Open label studies showing higher adherence than in VOICE & FEM-PrEP*
 - *Learning from PrEP demonstration projects that people self-sort into users or non-users*
- What will we learn in MTN 034?
 - *Safety in 16-17 year old women – key for product licensure*
 - *Patterns of adherence*
 - *Product Preference: will AGYW who cannot use a pill a day be able and willing to use a monthly vaginal ring?*

REACH Stakeholders Meetings 2016-2018

Young Women Took Center Stage

- At least one-third of stakeholders at each meeting were young women under age 25 – some as young as 16 and 17
- Included also young women experienced with using PrEP and ring (former ASPIRE participants)
- Pre-meeting workshops convened by AVAC and partners helped build confidence prior to the larger meetings

What we have heard young women say

- Neither the ring nor PrEP (or other methods) will be right for everyone
- Having choice is empowering; gives us control of our health and lives
- The products in REACH are themselves empowering
- It's time we placed our own health above our partner's desires

Using condoms is not so easy. If you try and negotiate, it's like you're saying you're not being faithful. [The ring and PrEP] would give me ownership. I don't have to tell my partner I'm using them.

If he says 'don't use it,' I won't. So, I think we should first deal with women – empower each other.

Study Timeline and Update

- First participant enrolled at the Uganda Site on 6 February .
- Screening ongoing at the Ugandan and Zimbabwean sites
- Remaining sites to be activated during Q1 2019
- Accrual completed by early-mid 2020
- Follow-up completed by mid-late 2021
- Results 2022

Early Lessons Learnt

- Community engagement to include male partners and significant others
- AGYW have little/no knowledge of contraception – critical that this be addressed during community engagement and pre-screening
- Bottle necks identified and visit flow to be streamlined
- Choosing participants with team analysis of potential participant profiles
- Menu of adherence support options, including adherence clubs.

Why do we need REACH?

- REACH will answer key questions about adherence and safety of PrEP and the ring in young women, including under age 18
- With PrEP being made available and the possibility that the ring will be approved...
 - We want to ensure these products can work for and be made available to **all girls and young women – regardless of age**
- The time is now – we can't afford to wait for a vaccine or something that may be better
- Ultimately, REACH is about empowering young women...
 - By putting HIV prevention in their hands, and ensuring they have different options from which to choose

Reverse the Epidemic in Africa with Choices in HIV Prevention
